- ABEM Terraloc Mk6, 134
- ABEM Terrameter SAS-300B, 127
- ABEM WADI, VLF receiver, 131
- accuracy
 - cross-hole radar tomography, 429–30
 - microgravity techniques, 429–30
 - resistivity surveys, 429
 - seismic surveys, 429
- acoustic characterization, geological structures, 75–88
- acoustic formation velocity, determination by animation, 86–88
- acoustic signal visualization (3D), 75–88
 - in hard formations, 75–79
 - in soft formations, 79–80
- acoustic transit time and resistivity, in pipework, 195, 196
- acoustic turbidity, 230–1
- airborne geophysics, Dounreay, 338
- airfilled cavities, largest negative gravity anomalies, 153
- airgun downhole, generating tube waves, 143
- airgun seismic source, 143
- Al-Dahr (Kuwait)
 - mass deficiency estimation, 162
 - microgravity survey, 156–62
- Alcubierre tunnel, use of SASW, 58
- Alhambra (Granada), 61
 - SASW tests, 59–60
- American Society for Testing Materials (ASTM), 29
- anisotropy
 - cross-hole seismics, 250–1
 - degree of, 274
 - electrical, 18, 293–4
 - percentage, Kensworth Chalk Quarry, 277
- apparent resistivity
 - anisotropy, 273–4
 - landfill, 134–6
- apparent resistivity pseudosection, 38, 236
- Arbre viaduct
 - Belgium, 167
 - radar velocity tomogram, 170, 172
- argillaceous sediments, thermal conductivity, 355–63
- artefacts
 - La Gileppe Dam tomography, 179–80
 - in processing, bore-hole seismics, 251
 - in radar tomography, 168
- attenuation with depth
 - P-waves, 80
 - pseudo Rayleigh waves, 80
 - S-waves, 80
 - Stoneley waves, 80
- attenuation tomography, 141
- Auriat borehole (Massif Central), 75, 76, 77, 78
- automatic first break picking, 393
- automatic gain control (AGC), georadar, 68
- automatic imaging, 38
- Average Claim Value, 384
- azimuthal apparent resistivity
 - Churn Estates, 277–9
 - Longwood Limestone Quarry, 280
 - polar diagrams, Kensworth Chalk Quarry, 275–6
- azimuthal resistivity, fracture orientations, 273–81
- azimuthal seismics, fracture orientation, 273–81
- azimuthal V_p velocity
 - polar diagrams
 - Churn Estates, 278, 279
 - Kensworth Chalk Quarry, 275–6
- back projection technique, pole-pole resistivity imaging, 237
- Balazuk, 1 borehole (Ardache), 87
- Barry Old Harbour
 - shallow reflection acquisition parameters, 215
 - shallow seismics, 211, 215–9
- basement aquifers
 - SE Zimbabwe, 307
 - integrated study, 307–12
- bender element, 365, 366, 367, 368
- bent-ray analysis, marginal gains, 260
- Bergen-op-Zoom, 295, 297
- Bernburg (Germany), seismic refraction survey, 407–11

 Campus Geopulse, 237
 cavities, effective size, 154
 cavity detection, using microgravity, 153–66
 cavity location, microgravity techniques, 183–92
 Cere-la-Ronde, 79, 81, 84
 Chalk
 dissolution features, 235–45
 seismic anisotropy greater than electrical resistivity, 280
 stiffness and porosity, 116, 117
 Chalk Marl, 327, 333, 334
 Channel Tunnel, marine route seismics, 327–34
 Channel Tunnel seismics
 borehole geophysics, 329, 331–3
 data accuracy and reliability, 330, 331
 data processing, 330
 instrumentation, 329
 methodology, 328–9
 position accuracy, 328
 Chek Lap Kok Formation (Hong Kong), 227, 228
 Chek Lap Kok (Hong Kong), high resolution seismic reflection survey, 225, 227–30
 Chek Lap Kok (Hong Kong) geophysics, 223–33
 chirp frequencies, 294
 circular ray paths, seismic tomography, 175
 Clarens Formation, 142
 coal-seam, as waveguide, 323
 coastal site investigation, multichannel high-resolution shallow seismics, 211–21
 Code de bonne pratique, 29
 coherence function, 55
 coherence function, of cross-spectrum, 55–6
 coherence and phase, 55
 Columbia buried metal test site, 111
 common midpoint (CMP) reflection seismics, coastal sites, 211
 compensated neutron log (CNL), 300
 concrete, electrical resistivity in damaged, 197
 conductivity landfill, 136
 conductivity surveying, leachate plumes, 20
 Construction Industry Research and Information Association (CIRIA), 4
 contact resistance, 41
 contaminant plumes, 90
 contaminant studies, 40–2
 contaminated sediments, in inland waterways, 295
 continuous surface wave (CSW), 119–20
 contract documentation, 430–1
 contrast, in physical properties, 10
 control on interpretation, lack of redundant data, 397
 correlation boreholes, 28
 Coventry Colliery
 event locations, 324
 in-seam microseismology, 323
 creep, salt rocks, 373–80
 Cretaceous Chalk, resistivity sounding, 201–9
 cross-borehole flowmeter measurements, 268–71
 cross-correlation and group velocity, soil shear wave velocity, 370
 cross-hole geophysical methods, 24–5
 cross-hole seismic data, variability in quality, 147
 cross-hole seismic tomography, 119, 141–51, 247–64
 curved ray analysis, 249
 cross-hole seismics, 119
 cross-hole survey instrumentation, 142–3
 cross-hole tomography, 119
 comparison of velocities with log data, 146
 curved ray path, 146
 dam foundation studies, 141–51
 faulted Oxford Clay, 256–59
 identification of shear waves, 146
 inversion algorithm, 147
 ray path geometry, 146
 signal to noise ratio, 143
 use of smoothing operator, 146
 crushed and microfractured zones, acoustic visualization, 79
 curved ray analysis, cross-hole seismic tomography, 249
 curved ray inversion, radar tomography, 169
- dam foundation studies, cross-hole tomography, 141–51
 dam site microgravity survey, 188–91
 damaged concrete, electrical resistivity, 197
 DC resistivity method, 90
 depth, of penetration (geophysical surveying), 9, 10
 depth to bedrock, electrical tomography, 39
 detonator seismic source, 219
 dielectric permittivity, 169
 Differential Global Positioning System (DGPS), 293
 diffraction, in cross-hole seismic tomography, 249
 diffraction tails, at ends of water table reflector (Epe), 66
 digital filtering, microgravity surveys (South Wales), 162, 163
 digital records, backed by paper copy, 393
 dilatant creep, rock salt samples, 373, 379
 dipmeter, 23
 discontinuities
 and stiffness, 117
 wireline logging, 303
 discontinuous sand layer, resolution of, 11
 dispersion curves, 54
 in homogenous embankment, 57
 in non-homogeneous embankment, 56
 uncontrolled waste dump, 58
 dissolution features, in Chalk, 235–45
 distance range concept, in REFRACT, 403–4
 disturbed zone, around cavities, 154
 divided bar apparatus, 358
 domestic waste, geotechnical properties, 136
 Downreay
 airborne geophysics, 338
 geophysical survey planning, 336–43
 Down Ampney, cross-hole seismic tomography, 256–9

 professional status, of engineering geologists and geophysicists, 427
 professionalism and standards, in the future, 425
 pseudo-Rayleigh waves, 77, 80
 pseudo-sections, resistivity, 193
 Pulse Ekko IV GPR system, 46
 Purton (Wiltshire), cross-hole seismics, 250–1, 252
 push moraines, imaging groundwater steps, 63–73

 quality assurance/quality control (QA/QC), 27, 30
 quality factors (Q1, Q2), rock salt samples under creep tests, 374–5, 375–8

 radar amplitudes, diagnostic for reflectors, 68
 radar attenuation, 169
 radar facies, for ice-pushed ridges, 66
 radar sections, probable fault, Saar region, 45–52
 radar tomography
 artifacts in, 168
 and foundation design, 167–73
 geotechnical interpretation, 169
 resolution, 168
 radar velocity
 determination, 69
 distribution, 168
 limestone water content, 169
 tomograms, Arbre viaduct, 170, 172
 Radioactive Logs, 22–3
 RAMAC tomographic inversion, 168
 random sampling, areas of contamination, 6
 ray bending, for planar features, 249
 ray coverage, cross-hole seismic tomography, 248–9, 250
 ray tracing
 ambiguity, 415
 verification, 415
 ray tracing example, 414
 Rayleigh wave data, correlation with borehole and trench logs, 98–100

 Rayleigh waves, 97–8, 118
 2D, 56
 depth of shallow landfill, 97–102
 effective depths, 98
 generation of, 97–98
 raytrace checking, 393
 Reciprocal and Intercept Time methods, 393
 Reciprocal Method, use in REFRACT, 404
 reciprocal and phantoming methods, in seismic refraction, 407–11
 redundant data, and interpretation control, 397
 reflected seismic signals, 10
 reflection seismics, 119
 REFRACT, 393, 394, 397, 398
 distance range concept, 403–4
 phantoming, 401–2
 segmentation, 401
 seismic refraction interpretation, 399–406
 use of reciprocal method in, 404
 refraction seismics, 119
 refractor depth, accuracy, 415
 refuse, prediction of depth, 100
 regional gravity gradients, removed by digital processing, 165
 regularized inversion, VLF(R) data, 45–52
 reliability index, refraction interpretation, 414
 resistivity anisotropy, 274
 resistivity imaging, 128
 resistivity method, environmental monitoring, 89–95
 resistivity pseudo-sections, 129
 resistivity sounding, for depth to Cretaceous Chalk, 201–9
 resistivity surveying, for cavities, 184
 Resix, 127
 resolution
 discontinuous sand layer, 11
 improved with subsurface-to-subsurface resistivity, 90
 vertical and lateral, 9, 10
 VLF(R) profiles, 47
 resonant column testing, 113, 348
 resource studies, electrical tomography, 39–40
 Road and Traffic Authority
 New South Wales, 283, 383, 384, 399–406
 experience with contracts, 384–5
 of NSW (RTA), 391–4
 rock fill dams, use of SASW, 60–1
 rock mass characterization, wireline logging, 304
 rock mass investigation, 428
 rock mass structure
 borehole-to-borehole tomography, 272
 geophysical soundings, 272
 rock porosity, *in situ*, 23
 rock properties from downhole seismics, compared with laboratory, 290
 Rock Quality Designation (RQD), 17
 La Gileppe Dam, 179
 RockWare, geology mapping, 294, 295
 Rugby UK, 16 kHz transmitter, 46

 Saar region, Germany
 geology, 45–6
 VLF(R) over a probable fault, 45–52
 Saar–Nahe Basin, Germany, 46
 salt rock samples, ultrasonics and long term creep tests, 373–80
 sampling, probability and, 6

- Schlumberger array, 18, 237, 244, 274, 276, 277, 279
 Schlumberger array (VES), 46
 Scintrex CG-3, 132
 Scintrex IGS-2, 46
 scroll cards, resistivity for sewers, 194
 SE Zimbabwe, lineaments, 307
 secant Young's Modulus, 114
 secondary creep, salt rock samples, 373
 secondary magnetic field, quadrature phase component, 104
 sediments
 with gas, 295
 thermal conductivity, 355–63
 segmentation
 accuracy, 414
 on travel time curves, 413
 using REFRACT, 401
 seismic cone, 119
 seismic interpretation, using REFRACT, 399–406
 seismic methods, 16–7
 determination of ground stiffness, 113–23
 seismic reflection, 134
 landfill sites, 134
 waterways sediments, 293–8
 seismic refraction, 91, 133–4
 evaluation of ray tracing, 413–6
 interpretation using REFRACT, 399–406
 landfill sites, 133–4
 practice
 early to mid-1980s, 391–2
 new, 392–4
 ray tracing, 413–6
 road construction, 383–90
 seismic and phantoming methods, 407–11
 seismic refraction in road construction, quantification of
 boulders, 385–7
 seismic refraction survey, Bernburg (Germany), 407–11
 seismic sections, appropriate scales, 394
 seismic sources, 133
 seismic surveys, for cavities, 184
 seismic tomography, 25
 in karstic environment, 168
 La Gileppe Dam, 175–82
 principles, 249
 SE Zimbabwe, 309–11
 limit to resolution, 310
 Seismic Travel Time Calibration (STTC), 333
 seismic velocity index (SVI), 17
 seismicity
 spatial distribution, Thoresby Colliery, 319–21
 temporal variation, Thoresby Colliery, 322–3
 seismics, high definition for Channel Tunnel, 327–34
 seismometer, Willmore Mk IIIA, 318
 Self-Potential (SP), 128–9
 Sellafield
 airborne geophysics, 341
 electromagnetics, 342
 geophysical survey planning, 336–43
 geophysical wireline logging, 299–305
 gravity survey, 341
 land seismics, 341
 marine seismics, 340–1, 342–3
 sewers, finite element modelling, 196–9
 shallow landfill, Rayleigh waves to detect depth, 97–102
 shallow mine workings, South Wales, 155
 shallow seismics
 Barry Old Harbour, 211, 215–9
 inland waterways, 293–198
 Port Talbot Docks, 211, 212–5
 Sham Wat Formation (Hong Kong), 227, 228
 shape, of attenuation with depth, 80
 shear bender elements, 348
 shear modulus, 75, 113, 114, 118
 consolidating soil, 350
 shear wave arrivals, first break and phase difference
 approaches, 367
 shear wave propagation, in consolidating soil, 349
 shear wave reflection, 134
 shear wave sonic (3DSVL) probe, 283
 shear wave source, 134
 shear wave tomography, SE Zimbabwe, 311
 shear wave velocity
 measurement in laboratory, 349
 sine wave input, 368, 369
 soft soils, 348
 square wave input, 368, 369
 in triaxial specimens, 366–7
 shear wave velocity method, effect on derived stiffness, 369
 shear wave velocity profiles
 in homogenous embankment, 57
 non-homogenous embankment, 56
 in waste landfill, 58
 shear wave velocity (V_s)-depth profile, 53
 shear modulus, borehole sonics, 22
 Sherwood Sandstone, 299, 318
 associated with surface fissuring, 321–2, 325
 short normal logs, 23
 signal-to-noise, Permo-Triassic and Devonian, 337
 signal-to-noise ratio, 9, 10
 simplified ray tracing routine, 413–4
 Simultaneous Iterative Reconstruction Technique (SIRT), 175
 single-point resistance log, 23
 site investigation, cross-hole seismic tomography, 247–64
 Slingram, difficult on rough terrain, 104
 Slingram configuration, for TDEM, 107
 Slingram equipment *see* FDEM
 Slingram response, conductive dyke, 103
 small strain triaxial testing, 365–71
 smoothness-constrained least-squares method, 38
 soft formations, 3D acoustic visualization, 79–80
 soil density, X-ray attenuation, 349
 soil and rock strength, evaluation, 430
 soil stiffness, small strain triaxial testing, 365–71
 Sonic Fracture Index (SFI), 22
 sonic log, 21
 sonic logs, 21
 spatial redundancy, in microgravity surveying, 165
 spectral analysis, microgravity surveys (South Wales), 162, 163
 Spectral Analysis of Surface Waves (SASW), 54–63, 119–120
 in tunnels, 58–9
 use at Alcubierre tunnel, 58–9
 use at Alhambra, 59–60
 use in control of soil improvement, 61
 use in liquefiable soils, 60
 use in rock-fill dams, 60–1
 in waste landfills, 57–8
 spherical and exponential compensation (SEC), 69

- spontaneous potential log, 23
 spontaneous potential probe (RSI), 283
 Standard Penetration Test (SPT), determination of stiffness, 118
 standards, and guidelines, 4
 statistical identification of orientations, microgravity surveys (South Wales), 162, 163
 stiffness
 chalk, 116
 in geotechnical design, 115
 and sample disturbance, 115
 seismic methods of measurements, 117–21
 stiffness behaviour, soils and rocks, 115–7
 Stoneley waves, 75, 76, 77, 80
 Straight Creek Tunnel, 18
 straight ray path inversion, radar tomography, 168, 169
 straight-ray analysis, stable, 260
 strain gauges, high-resolution, 113
 sub-bottom profiler, 293
 surface microseismic monitoring, Thoresby Colliery, 317–23
 surface resistivity, poor resolution for deeper targets, 90
 surface wave prediction, of plate test settlement, 121
 surface waves
 phase velocity, 54
 for surveying purposes, 54
 synthetic seismograms, 413
 Channel Tunnel, 332, 333
 synthetic VLF (R), 49
- TDEM and DC resistivity, joint inversion, 111–2
 TE (electric field parallel to strike), 47
 televiewer, ultrasonic, 24
 Terneuzen-Gent Canal, 295, 296
 terrain corrections, microgravity surveys, 154
 textural evolution, of rock salt samples, using ultrasonic data, 378–9
 TGV (High Speed Train), 167
 theoretical tomogram, 181
 thermal conductivity
 argillaceous sediments, 355–63
 calculation using geometric mean model, 361–2
 divided bar apparatus, 358
 laboratory measurements, 357–8
 and mineralogy, 355, 359–60
 and modelling, 357
 and porosity, 355–6, 359
 and temperature, 357, 361
 and texture, 356–7, 360–1
 Thoresby Colliery
 distribution of hypocentres, 320–2
 spatial distribution of seismicity, 319–21
 surface microseismic monitoring, 317–23
 temporal variation of seismicity, 322–3
 time domain electromagnetic systems (TDEM), 107–12
 central loop sounding configuration, 108, 111
 Slingram configuration, 107
 TM (magnetic field parallel to strike), 47
 tomogram artifacts, desirability of model simulations, 180
 tomograms, La Gileppe Dam, 178
 tomographic angular ray coverage, 143
 tomographic inversion (RAMAC), 168, 169
 tomography, radar, 167–73
 total terrain correction Tr, 154
- Transport and Road Research Laboratory (TRRL), 3
 Trawsfynnedd, cross-hole seismic tomography, 251–5
 Triassic Mercia Mudstones, 40
 Troxler nuclear density gauge, 136
 tube waves, generated by downhole airgun, 143
- ultrasonic bore-hole imager (UBI), 300
 ultrasonic televiewer, 24
 ultrasonics, and long term creep tests, 373–80
 underground pipework, evaluation, 193–200
 unforeseen ground conditions, 7
 University of Waterloo, Columbia, buried metal test site, 111
 unsaturated zone, fluid flow, 41–3
 up-hole seismics, 119
- velocity accuracy, refraction, 414–5
 velocity analysis, in REFRACT, 402–3
 velocity anisotropy, 274
 velocity determination (GPR), 67–8
 velocity distribution, 2D, 25
 velocity distributions, roadway construction, 387–8
 velocity inversion, theoretical limitations, 11
 velocity tomography, 141
 vertical component, potential field, 91
 vertical electric soundings, 127
 vertical gradient of gravity, derived from horizontal gradient, 154
 very low frequency (VLF), 131
 vibration meters, environmental control of Vibroseis, 338
 vibroseis seismic methods, 17
 Vibroseis survey, 337
 VLF method, 20
 VLF(R)
 comparison with GPR, 49–52
 directional limitations, 47
 minimum-structure models, 47–9
 VLF(R) data
 over probable fault, 45–52
 regularized inversion, 45–52
 VLF(R) profiles
 automated inversion, 47
 modelling, 47–9
 resolution of, 47
 V_p/V_s ratio tomogram, SE Zimbabwe, 312
- water table, visualization, 68
 waterway sediments, seismic reflection, 293–8
 waterways surveys, Netherlands, 293
 wave form, shape in triaxial tests, 370
 weather conditions, data quality, 338
 weathered chalk, plate loaded tests, 121
 weathered granite, boulders in, 385–7
 'weighting', in minimum-structure resistivity cross-sections, 49
 Wenner arrays, 18, 38, 39, 127, 134–6, 274, 277, 279, 376
 electrical resistivity imaging, 236, 237, 239, 240, 242, 243, 244
 Willmore Mk IIIA seismometer, 318
 wireline logging
 compared to geological core logging, 302–3
 data handling, 301–2
 data processing, 302

discontinuities, 303
drilling activities, 303–4
dynamic elastic parameters, 303
hydrogeological testing, 302
quality control, 301
realtime applications, 302–4
rock mass characterization, 304
wireline logs, drilling diagnostics, 301–2
Woburn landfill site, 127–8

Woburn Sands, 126
 physical properties of landfill site, 134–6
Worden Prospector (gravity meter), 155
X-STAR EG&G profiler, 293, 298
Young's Modulus, secant, 114
Young's Modulus (E), 113, 114, 118
 borehole sonics, 22
Young's Modulus (E_{max}), 53
